

## Procedures for Use PlantShield®

**PlantShield® HC** is a wettable powder formulation for use in drenching, spraying, or chemigation for plant disease prevention and control. The directions below outline techniques that will insure successful mixing and the best application of PlantShield HC.

### **DIRECTIONS:**

- Fill a bucket (or stock tank) with the desired amount of water.
- Add a half-teaspoon of a nonionic surfactant to the water and thoroughly mix (optional).
- Slowly add the appropriate amount of PlantShield HC, at a rate of 4-ounces per gallon of stock solution, when using a 1:100 injector ratio, while continuously mixing the solution. (See the tip below for an alternate method.)
- Vigorously mix the solution for at least 3 minutes.
- If a bucket is used, pour the suspension into the stock tank.
- **The stock tank should be agitated during application of PlantShield HC.**
- Place the inlet screen of the injector line **1" to 2" above the bottom of the stock tank.**
- Immediately apply the suspension: **again, make sure the stock tank is continuously agitated during application.**
- After treatment, be sure to do a clear water rinse to flush the injector.
- A small amount of residual carrier may be observed in the bottom of the stock tank after application. This is normal and does not affect the performance of PlantShield HC.

### **TIP: To Speed up the Wetting of PlantShield HC**

After weighing out or scooping the amount of PlantShield HC you need for your application, put it into a plastic bag; add enough water to make a slurry and twist-tie it closed. Shake the bag vigorously and, if necessary, break clumps by pinching through the bag. Pour out the slurry and rinse the bag into your stock tank or bucket. Then add the remaining amount of water needed. This greatly simplifies the process of getting PlantShield HC into suspension. It also eliminates any dust associated with stirring PlantShield HC into the water.
